HemoVoid™ Hemoglobin Depletion Kit

Depletion Plus Low Abundance Protein Enrichment For Erythrocyte Lysate Proteomics

- Hemoglobin voids in flow-through >98%, with <30 minute bind/wash/elute protocol
- Hemoglobin removal from red cell lysates for RBC proteomics
- Hemoglobin removal from hemolyzed serum
- Low abundance protein and enzyme enrichment
- Disposable, cost-effective
- Mild elution maintains tertiary structure and simple transfer to secondary analysis
- Removes hemoglobin from species including human, sheep, bovine, goat, etc.
- The eluted fractions retain their enzymatic and biological activity

HemoVoid™, a silica-based protein enrichment matrix, removes hemoglobin from erythrocyte lysate samples while concentrating low abundance, and/or low molecular weight proteins. The HemoVoid™ protocol uses mild buffers; the protocol conditions are so gentle that native enzyme activity is retained in elution fractions.

HemoVoid™ derives from a silica-based library of individual mixed-mode ligand combinations (ionic, hydrophobic, aromatic, polymer). The library was designed to facilitate weak binding of proteins, allowing for rapid elution from the matrix without any foreknowledge of the variety of proteins contained in the starting sample. HemoVoid™ depletes hemoglobin from red cell lysates while improving the resolution of less abundant blood proteins..

Materials and Methods. IEF Dimension: 2% pH [3.5 - 10.0] carrier ampholines were employed in 2mm glass tubes for focusing. Size dimension: Each IEF tube gel was sealed to a 10% acrylamide slab gel. After electrophoresis, proteins were fixed and silver stained. Molecular weight reference standards are represented on the far right side of each image.

Results and Discussion. When comparing the two gel images, the HemoVoid™ eluate (right) has been severely depleted of Hemoglobin. The remainder of the red cell proteins are substantially enriched (visualized) and are better resolved in the HemoVoid™ eluate. Many more proteins are detectable after HemoVoid™ treatment with extensive protein coverage across both dimensions.

BIOTECH SUPPORT GROUP

Product	Size	# of samples processed	Item No.	2012 Price
HemoVoid™	10 Preps	10, 300 µl of Serum Sample	HVK-10	\$350
HemoVoid™	50 Preps	10, 1500 µl of Serum Sample	HVK-50	\$1355
HemoVoid™	100 Preps	100, 3000 µl of Serum Sample	HVK-100	\$2150

NOTE: Please contact sales@biotechsupportgroup.com for prices in bulk amount.

Items Required	10 Prep	50 Prep	Reagent
HemoVoid™	0.5 gram	2.5 grams	Supplied
Binding Buffer HVBB, PH 6.0	15 ml	125 ml	Supplied
Wash Buffer HVWB, PH 7.0	15 ml	125 ml	Supplied
Elution Buffer HVEB, PH 9.8	15 ml	125 ml	Supplied
SpinX Centrifuge tube filters	10	50	Supplied

PROTOCOL – Based on processing 300 µl Sample

1. Weigh out 50 mg of **HemoVoid™** matrix in a spin-tube.
2. Add 250 µl of **Binding Buffer HVBB**. Vortex or mix well for 5 minutes at room temperature followed by centrifugation at 3000 rpm. Discard the supernatant.
3. Repeat step-2
4. Add 300 µl of **HVBB** and 300 µl of the **Sample**. Vortex for 10 min and then centrifuge for 2 minutes at 5000 rpm.
5. Remove the filtrate as Flow-Through **FT**.
6. To the pellet, add 500 µl of **Wash Buffer HVWB**. Vortex or mix well for 5 min and centrifuge for 2 minutes at 5000 rpm. Remove the filtrate as **Wash**.
7. Repeat Step-6, 2 times.
8. To the pellet, add 300 µl of **Elution Buffer HVEB**. Vortex or mix well for 10 min and centrifuge for 2 minutes at 5000 rpm. Remove the filtrate as **Elution**.
9. This elution is now ready for further analysis.

Note:

- The protocol can be scaled up or down proportionally to adjust for different serum volumes. The surface amount can be adjusted to accommodate more or less hemoglobin removal.
- We have 0.45µ SpinX centrifuge tube filters. If required can be ordered separately.
